## *Preface*

Recognizing the need for a reliable source of data describing the specialty of urology, the American Urological Association (AUA) has conducted its Annual Census since 2014. The Census consists of questions pertaining to important topics such as geographic distribution of providers, demographic characteristics, education and training, licensing and board certification, and patterns of practice. Each year the AUA receives a large number of potential questions from AUA committees, councils, sections, urology subspecialty societies and individual urologists. The goal of conducting the Annual Census is to gradually fill the knowledge gaps around the specialty with definitive information.

The AUA Annual Census is structured to analyze workforce practice and trends over time and to delve into new and emerging topics through base questions that are asked annually and new questions that vary each year. Responses to base questions in previous years are prepopulated in each subsequent year to be reviewed and updated as needed by the respondent. This strategy allows more time for participants to respond to the important questions on new topics, many of which provide data for use in lobbying and advocacy activities on behalf of the specialty. For instance, questions regarding burnout in the urologic community asked in the 2016 Annual Census have prompted specialty-wide discussion and efforts to recognize not only the impact of burnout on urologists, but also ways in which it can be minimized or prevented.

*The State of the Urology Workforce and Practice in the United States*, the annual publication summarizing Census findings, has emerged as a primary source of information about urology. Additionally, de-identified public use Census datasets from each survey are available to researchers for a nominal fee. Researchers have used these data to conduct studies and generate publications on the urologic practice and workforce.

As one of the AUA's primary data programs, the AUA Annual Census is now entering its fifth year of data collection. We encourage all urology community members to take part in and contribute to this important data effort each year. Please visit the AUA Census webpage at [www.AUAnet.org/Census](http://www.AUAnet.org/Census) for more information and results.

# Executive Summary

The AUA, with more than 21,000 members worldwide, is committed to providing the urologic community with the education, research, advocacy and statistics required to address the increasing challenges and opportunities presented to the profession as the demand for care grows. Data relating to the urology workforce and practice patterns play an important role in generating knowledge to inform workforce policy and urologic care.

Data collection for the 2017 AUA Annual Census began in May 2017 at the AUA Annual Meeting in Boston, MA, and continued online until the end of September 2017. A total of 6,018 urologists and other urologic care professionals, representing 109 countries and regions throughout the world, completed the 2017 AUA Annual Census. The results on U.S. practicing urologists were adjusted for non-responses and are reported in this annual publication.

The Census is a novel data source that explores the profession of urology from multiple angles through the collection of information from practicing urologists and other professionals, worldwide. The data collected assist in filling knowledge gaps and meeting research needs while, ultimately, improving patient care.

### *Definition of the Urologist Population*

Practicing urologists are defined as those with valid medical licenses reported in the National Provider Identifier (NPI) file as either urologists or pediatric urologists. Those who were reported as either surgeons or specialists in the NPI file were checked against the American Board of Urology (ABU) certification records maintained by the American Board of Medical Specialties (ABMS) and the American Osteopathic Board of Surgery (AOBS) certification records listed on the American Osteopathic Association (AOA) website. Urologists in residency training were excluded.

The 2017 U.S. urologist population consists of a total of 12,517 practicing urologists, which increased 2.7 percent from 12,186 practicing urologists in 2016.

### *Data Collection and Justification for Non-Response*

A total of 6,018 respondents completed the 2017 AUA Annual Census—3,639 of whom were from the United States. Of these, 2,323 census respondents were validated to be practicing urologists in the United States and formed the Census sample file. The population file and the Census survey sample file were linked using post-stratification factors (i.e., gender, location, certifica-

tion status and years since initial certification) to adjust for the non-response bias in a Census survey by using the assigned proper sample weight.

### *What is New in the 2017 AUA Annual Census?*

- Career satisfaction, including work-life balance factors
- Self-employment vs. general employment status
- Daily work hours, including night calls and patient interactions
- Accepted insurance providers and patient payer status
- Relative value units and type and amount of compensation related to clinical activities
- Practicing urologists in academic institutions

The AUA strongly encourages all members to complete the Census each year either during the AUA Annual Meeting or between May and September online at [www.AUAnet.org/TakeCensus](http://www.AUAnet.org/TakeCensus).

## KEY FINDINGS

- There are 12,517 practicing urologists in the United States.
- Of the 12,517 practicing urologists, 80 percent are considered to be actively practicing (Table 1-1), which is lower than 90 percent in 2016.
- The national urologist-to-population ratio increased to 3.85 per 100,000 population in 2017 (Table 1-2), up from 3.77 in 2016.
- The percentage of practicing urologists in the United States who maintain their primary practice locations outside of metropolitan areas increased to 10.7 in 2017 (Table 1-5) from 10.1 in 2016.
- The percentage of female urologists grew to 8.8 percent of the U.S. urologist population in 2017, up from 8.5 percent a year ago. And for the first time, the rising number of women surpassed 20 percent of all practicing urologists under the age of 45 in 2017 (Figure 2-1).
- Nearly 38 percent of urologists have completed at least one fellowship program during their career (Table 3-2). Practicing urologists in younger age groups are more likely to have completed fellowship training than practicing urologists in older age groups, and women age 45 or older are more likely to have completed

fellowship training than their male counterparts (Figure 3-1).

- Nearly 89 percent of practicing urologists in the United States are certified by the ABU, the AOBS or both (Table 3-6).
- Female practicing urologists are more likely to work in academic medical centers than their male counterparts (34.4 percent and 24.3 percent, respectively) (Table 4-3).
- Nearly 40 percent of practicing urologists in the United States have a primary subspecialty (Table 4-6), with oncology as the most common area (Table 4-7).
- The percentage of urologists who performed inpatient procedures decreased from 84.2 percent in 2014 to 78.4 percent in 2017 (Table 4-8).
- The percentage of employed urologists increased over the past four years to nearly 56 percent in 2017 (Table 4-11).

Approximately **one-third** of urologists work more than 60 hours a week (Table 5-1).

60+ hours

- The average number of work hours per week decreased to 51.6 hours (Table 5-5) in 2017 from 55.5 hours in 2016, mainly due to a reduction of clinical hours.

Approximately 93 percent of urologists would **choose urology** as their medical specialty if they had to choose again (Table 6-4).

93%

- Female practicing urologists age 45 or older are less likely to feel their work schedules leave them enough time for personal and/or family life compared to both younger female practicing urologists and their male counterparts (Figure 6-1).
- Female practicing urologists under age 45 are more likely to have symptoms of work-related physical discomfort in the last 6 months (Figure 6-2).
- Adopting electronic health records (EHRs) and fulfilling CMS mandates are the top factors that cause urologists' job dissatisfaction (Tables 6-8, 6-9 and 6-10).
- Approximately 41 percent of urologists have experienced ergonomic stress from performing surgery (Table 6-12).
- Avoiding the business challenges associated with running a practice, guaranteed income, and collegiality

amongst colleagues are the top three reasons for urologists to choose to be employed (Table 7-1).

- Among those urologists who were previously an owner or partner of their practice, approximately 63 percent of them feel happier after switching to employment (7-3). In contrast, nearly 85 percent of practicing urologists reported being happier moving from being employed by others to owning their own practice (Table 7-11).
- Nearly one-third of practicing urologists reported receiving a straight annual salary in 2017 (Table 7-4). Practicing urologists in the older age groups are more likely to receive a straight salary (Table 7-5 and Figure 7-1).
- A vast majority of self-employed practicing urologists (92.3 percent) believe being a practice owner or partner provides greater opportunity for better patient care (Table 7-13).
- Approximately 62 percent of practicing urologists feel urology lends itself to part-time practice (Table 8-3).
- Approximately 32 percent of practicing urologists are aware of the percentage of their patients who are in financial hardship due to medical costs (Table 9-6).

**No statistically significant gender difference in take-home pay related to clinical activities was seen (Figure 10-2).**

- There are 3,157 practicing urologists working in academic institutions, of which 1,234 are assistant professors, 660 are associate professors, and 1,038 are full professors (Table 11-2).

## CONCLUSION

The AUA Annual Census provides the urology community with a reliable and sustainable mechanism to describe practicing urologists in the United States, to understand their medical training and practicing characteristics and to identify cross-sectional and longitudinal variations across the specialty. The mechanism not only generates a novel data source to explore the profession of urology, but can be adapted to all medical specialties as well. The results are being used to inform health care policy and the preparation of future physician workforce.

The AUA strongly encourages all members to complete the Census each year either during the AUA Annual Meeting or between May and September online at [www.AUAnet.org/TakeCensus](http://www.AUAnet.org/TakeCensus).

# About the American Urological Association

## THE ORGANIZATION

Founded in 1902 and headquartered near Baltimore, Maryland, the AUA serves more than 21,000 members throughout the world as a leading advocate for the specialty of urology. The AUA is a premier urologic association, providing invaluable support to the urologic community by fostering the highest standards of urologic care.

## AUA MISSION

The AUA mission is to promote the highest standards of urological clinical care through education, research, and the formulation of health care policy.

## AUA VISION

The AUA vision is to be the premier professional association for the advancement of professional urologic patient care.

For more information about the AUA, please visit [www.AUAnet.org](http://www.AUAnet.org).

# About the AUA Annual Census

As a premier urologic association, the AUA is committed to serving the urologic community. The AUA supports the generation and dissemination of urologic knowledge through a systematic approach. The AUA's Annual Census is a systematically designed, specialty-representative survey of urology (similar to the U.S. Census). The results of the AUA's Annual Census are weighted to adjust for non-response bias, to accurately represent the entire specialty and to address the broad landscape of urology.

This publication serves as a primary source of information for the urology workforce in its effort to effectively convey the needs and demands of the urologic community. The findings also depict current clinical practice, including the use of EHRs, mechanisms to report quality measures and medications and procedures to treat urologic conditions of interest to the urologic community. Results from this publication provide an array of information that can bridge knowledge gaps, provide data to meet increasing research needs and, ultimately, improve patient care. Future Census publications will expand on initial findings, report trends over time, and identify cross-sectional and longitudinal variations across the specialty nationally and globally.

# Definition of Terms

## PRACTICE STATUS

In order to understand the manner in which this report classifies urologists, a Definition of Terms is provided:

**UROLOGISTS:** Physicians and surgeons who are specially trained for the diagnosis and treatment of genitourinary and adrenal gland diseases in patients of any age and of either sex

**PRACTICING UROLOGISTS:** Urologists who maintain current medical licensures and treat patients with urologic conditions

**PRACTICING UROLOGISTS IN THE UNITED STATES:** Practicing urologists with primary practice locations in at least one of the 50 U.S. states or the District of Columbia

**ACTIVE PRACTICING UROLOGIST:** Practicing urologists who treat patients with urologic conditions and who work at least 25 clinical hours per week

**CERTIFIED UROLOGISTS:** Urologists who are certified either by the ABU or the AOBS

## LEVEL OF RURALITY

The ZIP code of each practicing urologist's primary practice location was converted to a rural-urban commuting area (RUCA) code based on RUCA3.10<sup>1</sup> (developed collaboratively by the Health Resources and Service Administration's Office of Rural Health Policy [ORHP], the United States Department of Agriculture's Economic Research Service [ERS], the WWAMI Rural Health Research Center [RHRC] based on 2010 United States Census work-commuting data, and 2012 United States Census Bureau revised urban area definition based on 2010 Census data and 2013 ZIP codes).

RUCA3.10 codes were grouped into four levels of rurality. An area with population size  $\geq 50,000$  was defined as a Metropolitan Area. An area with population size  $< 50,000$  was defined as a Non-Metropolitan Area. The Non-Metropolitan Area was further classified: Metropolitan Area (population = 10,000-49,999), Small Town (population = 2,500-9,999), and Rural Area (population  $< 2,500$ ).

# Methodology

Data in the AUA Annual Census were collected and analyzed using survey methodology developed by Groves et al.<sup>2</sup> Two data files were established. One file was a population file containing basic demographic, geographic, and certification information for all practicing urologists in the United States in 2017. Another file was a sample data file containing a broad range of information collected from the Census. The population file and the Census survey sample file were linked through post-stratification factors to adjust for non-responses and the contribution of each respondent in a Census survey by assigned sample weight.

## PRACTICING UROLOGIST POPULATION

Practicing urologists were identified jointly from the NPI file, which includes all physicians in the United States who hold valid medical licenses; ABU certification records maintained by the ABMS; and the AOBS certification records from the AOA website if the following criteria were met:

- Either urology or pediatric urology was listed as the medical specialty.
- A provider was listed as either a surgeon or a specialist and matched to either the 2017 ABU certification records as a urologist or the AOBS certification records as a urological surgeon. Manual checks of all individual urologists' and urologic surgeons' websites were performed to confirm that these physicians provided urologic care in 2017.
- Urologists in residency training were excluded.
- Urologists who were identified as certified by the ABU and/or the AOBS but not listed in the NPI file were excluded in order to ensure inclusion of only currently practicing urologists.

## ORGANIZATION OF QUESTIONS

The Census consists of “base” and “supplemental” questions. Base questions that target the entire urology specialty will be asked annually in order to identify cross-sectional and longitudinal patterns. Examples of base question topics include practice status, clinical practice setting, primary and secondary subspecialties, patient encounters, and employment status. Supplemental questions will vary each year and focus on emerging

issues; these questions may be distributed either to all participants or to a random subset of participants.

## CENSUS TIMELINE

The AUA Annual Census officially launches during the AUA Annual Meeting, and the Census is available to respondents online through September of that same year. Census data are analyzed and reported in the annual publication *The State of the Urology Workforce and Practice in the United States*, which is available in the spring of the following year.

## CENSUS DATA COLLECTION

Data collection for the 2017 AUA Annual Census began on May 12, 2017 during the 2017 AUA Annual Meeting and ended on September 30, 2017. Each respondent was assigned an identification number prior to the submission of responses to the Census questions. This step ensured the results could be linked to the population file and no respondent could take the survey more than once.

A total of 6,018 respondents completed the 2017 AUA Annual Census—2,323 of whom were practicing urologists in the United States. Those who self-reported as practicing urologists were checked against the practicing urologist population file and removed if there were no matches found. Those who were practicing outside the United States were also removed from this study, but their responses will be analyzed and reported separately with final analysis available on the AUA website.

## SAMPLE WEIGHTING

The purpose of a survey is to sample the entire population of interest; generalizing the collected data to the rest of the population. In order to achieve this aim, the sample needs to be representative (i.e., reflect the characteristics of the population from which it is drawn); however, surveys often over-sample some subgroups of the population and under-sample others. In other words, unless a certain response rate is achieved, survey samples usually do not represent the population. The way in which a certain characteristic (e.g., age, education, race, sex) of a sample is distributed in the survey data may differ from the way it is distributed in the population. Thus, sample weighting is performed to address this difference. Post-stratification factors are used with lesser weight given to over-sampled data and greater weight given to under-sampled data. This utilization provides a mathematical correction for these biases, and a key

result is reasonable statistical confidence. The post-stratification factors are those significant characteristics that distinguish urologists from the sample and from the population.

In order to adjust for non-responses and resulting biases in the 2017 AUA Census sample, a standard post-stratification weighting technique was used to identify post-stratification factors. Identified factors include gender, geographic location, certification status, and years since initial certification. These factors were used to develop stratification cells for calculating sample weights.

## CENSUS REPORTING WITH STATISTICAL CONFIDENCE

Results were based on either weighted Census samples or the practicing urologist population data described earlier in this report. Reported statistics based on the population data were preferred because of the lack of sampling bias. In contrast, when reported findings were based on weighted Census samples, error estimates were reported in the form of either margin of error (MOE) or confidence interval (CI), with estimation of measurement precision at a 90 percent level of confidence.

## DATA ANALYSIS

After post-stratification weighting adjustment, the Census data were analyzed with IBM-SPSS Complex Samples 22.0.

## MARGIN OF ERROR

Estimates of characteristics of the practicing urologists from the AUA Census sample data can differ from those that would be obtained if all practicing urologists were surveyed. MOE values at the 90 percent confidence level were used to measure and report the precision of each estimate. The MOE is the difference between an estimate and its upper or lower confidence bounds. The AUA reports both estimates and their associated MOE values in alignment with the U.S. Census Bureau in reporting the U.S. Census/American Community Survey.

## CONFIDENCE INTERVALS

Estimates based on the AUA Census samples can differ from those that would be obtained if all practicing urologists were surveyed. A 90 percent confidence interval (90% CI) was used to mark the upper or lower confidence bounds of the estimated parameter by Census samples with 90 percent statistical confidence.

## LIMITATIONS

The results of the AUA Annual Census are subject to the following limitations:

- As a population-based and weighted survey, the analysis of the AUA Annual Census data relied on the absolute number of responses to report statistics for small geographic, demographic, and clinical categories. Women and racial/ethnic minority groups were not well represented in the urologist population and, therefore, were difficult to analyze.
- AOBS certification of osteopathic doctors was obtained via the AOA's online urologic surgeon list without direct verification by the AOBS. Information contained in the AOA's "DO Directory" (public list) is not the primary source for verification of physician credentials.
- The AUA Annual Census is subject to sampling and estimate errors. Thus, the MOE is the appropriate tool when comparing two groups.
- The practicing urologist population in the United States was based on the assumption that urologists who maintain their medical licenses in the Census year are considered practicing urologists.
- Geographic classifications, such as levels of rurality and state, were determined based on the primary office location in the NPI file. The actual geographic coverage of practice for each practicing urologist may be beyond the area reported.
- Census data are self-reported, non-validated, and subject to bias or misrepresentation.

# Practicing Urologists

*in the United States*

# Section 1: Geographic Distribution

## Primary Observations

- In 2017, 12,517 urologists were identified as “practicing urologists” in the United States. Of those practicing urologists, 80 percent are “actively” practicing (Table 1-1) compared to 90 percent in 2016.
- The national urologist-to-population ratio increased to 3.85 per 100,000 in 2017, up from 3.77 in 2016 and 3.72 in 2015. Among the 50 U.S. states, New Hampshire has the highest urologist-to-population ratio, while Nevada has the lowest (Table 1-2).
- The AUA’s Southeastern Section has the greatest number of practicing urologists, accounting for 21.3 percent of the total practicing urologist population in the United States (Table 1-3).
- Practicing urologists maintain their primary practice locations in nearly 37.8 percent of all U.S. counties (Table 1-4), up from 36.5 percent in 2016.
- The percentage of practicing urologists in the United States who maintain their primary practice locations outside of metropolitan areas increased to 10.7 in 2017 (Table 1-5), up from 10.1 in 2016 and 9.3 in 2015. The likelihood of practicing urologists maintaining their primary practice locations in non-metropolitan areas increases with the age of the urologist (Figure 1-5).

**TABLE 1-1**  
**Practice Status**

Type of Urologist	Number of Practicing Urologists	Percent (%)
Practicing Urologists	12,517	100.0
Active Practicing Urologists	10,012*	80.0

(Data source: NPI 09/2017 file, ABU certification records from the ABMS Directory of Board Certified Medical Specialists, AOA DO Directory; 2017 AUA Annual Census. \*Active practicing urologists are defined as those who work 25 or more clinical hours per week.)

\*Bold numbers are point estimates. The dashed bars represent upper and lower 90% confidence limits.

# Section 2: Demographic Characteristics

## Primary Observations

- The median age of practicing urologists in the United States is 55 years (Table 2-1).
- The urologic workforce in the United States is predominantly male (Table 2-2).
- The percentage of female urologists increased to 8.8 percent of the U.S. urologist population in 2017, up from 8.5 percent a year ago. And for the first time, the rising number of women surpassed 20 percent of all practicing urologists under the age of 45 in 2017 (Figure 2-1).
- Among practicing urologists, there are higher percentages of females observed in the younger age groups (Figure 2-1). These data suggest an increasing number of females are entering the urologist workforce in the United States.
- The urologist workforce in the United States is predominantly non-Hispanic (Table 2-3 and Table 2-4).

**TABLE 2-1**

### Age

Age Group (Year)	Population Represented		
	Number	Percent (%)	± MOE (%)

(Data source: Weighted samples from the 2017 AUA Annual Census.)

# Section 3: Education, Training, State Licensing, Certification, and Years of Practice

## Primary Observations

- Nearly 38 percent of urologists have completed at least one fellowship program during their career (Table 3-2). Practicing urologists in younger age groups are more likely to have completed fellowship training than practicing urologists in older age groups, and women ages 45 or older are more likely to have completed fellowship training than their male counterparts (Figure 3-1).
- The top three areas for fellowship of practicing urologists are: Oncology, Robotic Surgery and Pediatrics (Table 3-3).
- Approximately 19 percent of practicing urologists in the United States maintain medical licensure in more than one state (Table 3-5).
- Nearly 89 percent of practicing urologists in the United States are certified by the ABU, the AOBS or both (Table 3-6).
- Practicing urologists in the United States have practiced urology for a median of 22 years since completing residency, while 31.1 percent of practicing urologists have more than 30 years of experience (Table 3-7).

**TABLE 3-1**  
Age at Completion of Residency

Age at Completion of Residency	Population Represented		
	Number	Percent (%)	± MOE (%)
≤ 30	1,121	9.0	1.2
31	2,099	16.8	1.5
32	3,478	27.8	1.8

<b>Total Reported</b>	<b>12,517</b>	<b>100.0</b>	<b>1.1</b>

(Data source: Weighted samples from the 2017 AUA Annual Census. The median number of years practicing urology since completion of residency is 22.)

# Section 4: Characteristics of the Urology Practice

## Primary Observations

- Nearly 60 percent of practicing urologists in the United States are in private practice (including solo, single urology, or multispecialty groups) (Table 4-2). Male urologists ages 45 or older are more likely to choose private practice than those who are under 45 (Figure 4-2).
- Female practicing urologists are more likely to work in academic medical centers than their male counterparts (34.4 percent and 24.3 percent, respectively) (Table 4-3).
- Nearly 40 percent of practicing urologists in the United States have a primary subspecialty (Table 4-6); oncology is the most common area (Table 4-7).
- Nearly 80 percent of practicing urologists in the United States reported performing one or more major inpatient surgical procedure in a typical month (Table 4-8). The percentage of practicing urologists who perform inpatient surgical procedures decreases with age (Table 4-9).
- Female practicing urologists are more likely to be employed by others compared to their male counterparts in both younger and older age groups (Figure 4-5).

**TABLE 4-1**

# Section 5: Work Hours, Patient Encounters, and Practice Patterns

## Primary Observations

- Approximately one-third of urologists work more than 60 hours per week (Table 5-1).
- The median number of minutes a practicing urologist spends with a patient in a typical office visit is 15 minutes (Table 5-3).
- In 2017, the average number of worked hours per week decreased to 51.6 hours (Table 5-5), compared to 55.5 hours in 2016.
- In 2017, the median number of clinical hours directly related to patient care per week decreased to 45 hours from 50 hours in 2016.
- Practicing urologists work a median 48 weeks per year (Table 5-9) and see 70 patients in a typical week, suggesting an estimated 3,360 patient visits/encounters per urologist each year.
- Nearly 30 percent of practicing urologists in the United States plan to fully retire after age 70 (Table 5-10).

# Section 6: Professional Satisfaction, Life and Work Balance, and Physical Discomfort

## Primary Observations

- Approximately 93 percent of urologists would choose urology as their medical specialty if they had to choose again (Table 6-4).
- Female practicing urologists age 45 or older are less likely to feel their work schedules leave them enough time for personal and/or family life compared to both younger female practicing urologists and their male counterparts (Figure 6-1).
- Female practicing urologists under age 45 are more likely to have symptoms of work-related physical discomfort in the last 6 months (Figure 6-2).
- Adopting EHRs, fulfilling CMS mandates, and dealing with office staffing and complicated requirements are the three top factors contributing to urologists' job dissatisfaction (Tables 6-8, 6-9 and 6-10).
- Approximately 41 percent of urologists have experienced physical discomfort attributed to performing surgery (Table 6-12).

Early Retirement	774	7.8	1.3

(Data source: Weighted samples from the 2017 AUA Annual Census.)

# Section 7: Employment vs. Self-Employment

## *Primary Observations*

- The top three reasons for urologists to choose employment (vs. being self-employed) include not having to deal with the business of running a practice, guaranteed income, and collegiality amongst colleagues (Table 7-1).
- Among those employed urologists who were an owner or partner of their practices previously, approximately 63 percent of them feel happier after switching to employment (Table 7-3). In contrast, close to 85 percent of practicing urologists who were employed previously feel happier after switching to self-employment (Table 7-11).
- About one-third of practicing urologists reported receiving a straight annual salary in 2017 (Table 7-4), and practicing urologists in the older age groups are more likely to receive a straight salary (Table 7-5 and Figure 7-1).
- A vast majority of self-employed practicing urologists (92.3 percent) believe being a practice owner or partner provides greater opportunities for patient care (Table 7-13).
- Almost the same percentages (approximately 67 percent) of the employed and self-employed practicing urologists believe their current employment status provides greater financial security (Table 7-14).

## Part 1: Employed Practicing Urologists

### *Definition:*

- Employed practicing urologists are those who identified themselves as employed by others only.
- Employed practicing urologists may work in any work setting including institutions such as academic medical centers, public and private hospitals, and independent practices such as single urology practices and multi-specialty practices.

**TABLE 7-1****What Do You Like Most about Employment?**

# Part 2: Self-Employed Practicing Urologists

## Definition:

- Self-employed practicing urologists are those who identified themselves as either a sole owner or a partner of their practice.
- Self-employed practicing urologists usually work in private practices including solo practices, single urology practices and multi-specialty practices.

**TABLE 7-8**

# Section 8: Full-Time, Part-Time, Daily Patient Quota, and Night Calls

## Primary Observations

- 93 percent of full-time practicing urologists who work 40 hours or more per week in 2017 plan to continue to be full-time in 2018 (Table 8-2).
- Approximately 62 percent of practicing urologists feel that urology lends itself to part-time practice (Table 8-3).
- Approximately 78 percent of employed practicing urologists do not receive extra compensation for being on call (Table 8-7).

**TABLE 8-1**

# SECTION 9: Medical Insurance Acceptance and Patients from Vulnerable Populations

## Primary Observations

- Nearly three-fourths of practicing urologists accept Medicaid HMO patients (Table 9-1).
- Approximately 42 percent of practicing urologists report the percentage of uninsured patients they see in their practice has remained consistent since 2015 (Table 9-3).
- Approximately 32 percent of practicing urologists are aware of the percentage of their patients who are in financial hardship due to medical costs (Table 9-6).

# SECTION 10: Relative Value Unit (RVU) Activity and the Take-Home Pay Related to Your Clinical Activity

## Primary Observations

- Nearly half of the practicing urologists in the United States earn more than \$350,000 as their take-home pay related to their clinical activities (Table 10-3).
- The median take-home pay related to clinical activities was approximately \$350,000 in 2017 (Table 10-3).
- No statistically significant gender difference in take-home pay related to clinical activities was seen (Figure 10-2).

# SECTION 11: Practicing Urologists in Academic Institutions

## Primary Observations

- There are 3,157 practicing urologists working in academic institutions, of which 1,263 are assistant professors, 660 are associate professors, and 1,234 are full professors (Table 11-2).
- On average it takes approximately 6 years for practicing urologists to advance from assistant professors to associate professors and 12 years to become full professors (Table 11-5).
- Approximately 46 percent of practicing urologists in academic institutions have been principal investigators (PI) in grant-funded projects (Table 11-7).

**TABLE 11-1**

Academic Career Track Description	Population Represented		
	Number	Percent (%)	+/- MOE (%)
Clinician-Educator	1,749	55.4	4.0
Clinician-Researcher, NIH-Funded	469	14.8	2.8
Clinician-Researcher, Self-Funded	407	12.9	2.6
Clinical-Researcher, Industry-Funded	235	7.4	2.2
Clinician-Only	175	5.5	2.0
Others	122	3.9	1.4
<b>Total</b>	<b>3,157</b>	<b>100.0</b>	

(Data source: Weighted samples from the 2017 AUA Annual Census.)

**TABLE 11-2**  
Academic Level

Level	Population Represented		
	Number	Percent (%)	+/- MOE (%)
Assistant Professors	1,263	40.0	2.9
Associate Professors	660	20.9	2.7
Full Professors	1,234	39.1	2.9
<b>Total</b>	<b>3,157</b>	<b>100.0</b>	

(Data source: Weighted samples from the 2017 AUA Annual Census.)

**TABLE 11-3****Academic Level (by Gender)**

Level	Male Urologists			Female Urologists		
	Number	Percent (%)	+/- MOE (%)	Number	Percent (%)	+/- MOE (%)
Assistant Professors	1,014	36.5	3.5	249	65.4	8.0
Associate Professors	579	20.9	2.9	81	21.2	7.9
Full Professors	1,183	42.6	3.3	51	13.4	1.4
<b>Total</b>	<b>2,776</b>	<b>100.0</b>		<b>381</b>	<b>100.0</b>	

(Data source: Weighted samples from the 2017 AUA Annual Census.)

**TABLE 11-4****Average Age by Academic Levels**

Professor Level	Population Represented		
	Number	Average Age	+/- MOE
Assistant Professor	1,262	44.1	1.6
Associate Professor	660	49.8	1.3
Full Professor	1,234	62.1	0.9
<b>Total Reported</b>	<b>3,157</b>	<b>100.0</b>	

(Data source: Weighted samples from the 2017 AUA Annual Census.)

**TABLE 11-5****Average Number of Years in Tenure Track Transition**

Average Years	Population Represented		
	Number	Years	+/- MOE
From Assistant Professor to Associate Professor	1,750	6.2	0.3
From Associate Professor to Full Professor	1,130	6.7	0.4
From Assistant Professor to Full Professor	1,129	12.0	0.5

(Data source: Weighted samples from the 2017 AUA Annual Census.)

**TABLE 11-6****Total Number of Published Peer-Reviewed Manuscripts**

Number of Published Peer-Reviewed Manuscripts	Population Represented		
	Number	Percent (%)	+/- MOE (%)
< 10	594	18.8	3.2
10-29	721	22.8	3.1
30-49	432	13.7	2.6
50-99	625	19.8	3.0
≥ 100	784	24.8	3.0
<b>Total</b>	<b>3,157</b>	<b>100.0</b>	

(Data source: Weighted samples from the 2017 AUA Annual Census.)

**TABLE 11-7****Being a Principal Investigator (PI) of Grant-Funded Projects**

Being a Principal Investigator (PI) of Grant-Funded Projects	Population Represented		
	Number	Percent (%)	+/- MOE (%)
Yes	1,368	45.7	3.9
No	1,623	54.3	3.9
<b>Total Reported</b>	<b>2,991</b>	<b>100.0</b>	
Not Reported	166		
<b>Total</b>	<b>3,157</b>		

(Data source: Weighted samples from the 2017 AUA Annual Census.)

**TABLE 11-8****Number of Grant-Funded Projects for Which You Have Been a Principal Investigator (PI)**

Number of Grant-Funded Projects as a PI	Population Represented		
	Number	Percent (%)	+/- MOE (%)
≤ 2	533	39.0	5.2
3-4	360	26.3	4.0
5-8	256	18.7	3.5
≥ 9	187	13.7	3.6
Not Reported	32	2.3	1.8
<b>Total</b>	<b>1,368</b>	<b>100.0</b>	

(Data source: Weighted samples from the 2017 AUA Annual Census.)

# Contributors

## PRINCIPAL PHYSICIAN ADVISORS:

Steven M. Schlossberg, MD, MBA – Data Committee Chair

J. Stuart Wolf, Jr. MD, FACS – Science and Quality Council Chair

Patrick McKenna, MD – Workforce Work Group Chair

Christopher M. Gonzalez, MD – Public Policy Council Chair

## PROJECT OVERSIGHT:

Heddy Hubbard, PhD, MPH, RN, FAAN – Executive Vice President for Research, Quality and Scientific Affairs and Chief Science Officer, Program Advisor

## PROJECT TEAM:

Raymond Fang, MSc, MAsc – Data Director, Principal Investigator

William Meeks, MA – Data Operations Manager, Survey Programming and Statistical Analysis

Daniel Pichardo – Biostatistician, Data Analysis

Roxann Nottingham – Outreach Specialist, Project Coordination and Communication

Keonna Confesor, MS – Data Support Specialist, Project Administration

Erin Kirkby, MSc – Medical Writer and Guidelines Manager, Report Editing

## ADVISORY GROUPS:

AUA Data Committee

AUA Workforce Work Group

## KEY CONTRIBUTORS: (IN ALPHABETICAL ORDER)

Jennifer T. Anger, MD

Timothy D. Averch, MD

Benjamin N. Breyer, MD

Thomas Chi, MD

Peter E. Clark, MD

Matthew R. Cooperberg, MD

Julie Franc-Guimond, MD

Matthew Gettman, MD

John L. Gore, MD

Gerald H. Jordan, MD

Melise A. Keays, MD

Danil V. Makarov, MD

Amanda C. North, MD

Sandip Prasad, MD, MPHIL

Raj Pruthi, MD

Sanoj Punnen, MD

Matthew J. Resnick, MD

Eugene Rhee, MD

Daniel J. Sadowski, MD

Jeremy B. Shelton, MD

Aaron Spitz, MD

Ronald S. Suh, MD

## KEY STAFF COLLABORATORS: (IN ALPHABETICAL ORDER)

Carolyn Best – Director, Office of Research

Suzanne Pope – Director for Quality

Diane Bieri – General Counsel

Bradley Stine – Director, Government Relations & Advocacy

Valerie Brown – Marketing Coordinator

Joshua Webster, MPA – Coordinator, Government Relations & Advocacy

Christine Frey – Manager, Corporate Communications

Wendy Isett – Manager, Advocacy Communications
